In this section, we will proceed to an exploratory data analysis of the German Credit data.

Let's start by importing the dataset.

```
German_credit <- read.csv("./../Data_DA/GermanCredit.csv", header = TRUE, sep = ";")</pre>
```

Get to know the data

Title: german credit data

Name of the file: GermanCredit.cvs

Abstract

##

The German Credit data has data on 1000 past credit applicants, described by 30 variables. Each applicant is rated as "Good" or "Bad" credit (encoded as 1 and 0 respectively in the response variable).

Goal: We want to obtain a model that may be used to determine if new applicants present a good or bad credit risk

• Number of instances: 1000 • Number of attributes: 30 • Attribute Information :

: int

str(German credit)

```

• There are no missing values.

```
which(is.na(German_credit))
```

integer(0)

• The response variable is the 'Response' variable - last column on the data.

Response variable: credit rating is good

- 1. 0 : No
- 2. 1 : Yes

We have to make sure that the class of the variables are correct. As described above, all the variables are defined as *integer* but we know that we should have numerical and categorical variables in our dataset. Therefore, we have to transform the class of some of them.

```
German_credit$DURATION <- as.numeric(German_credit$DURATION)

The binomial data are set as factors and the others as numerical.

We can now describe the variables one more time and we should get better results.

describe(German_credit)

plot_intro(German_credit)
```

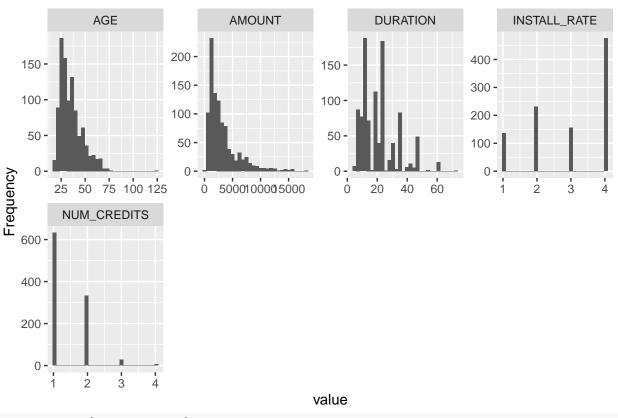

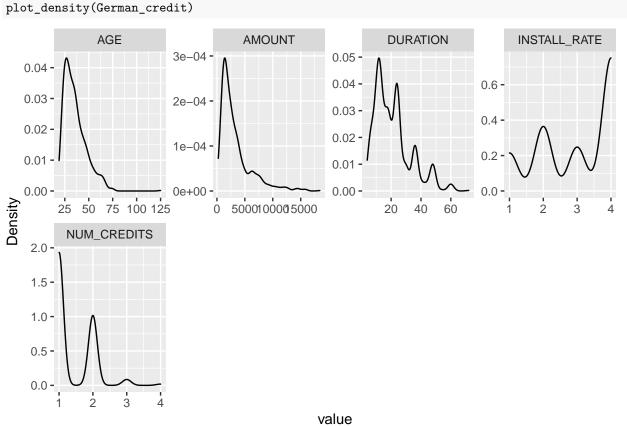

The plot helps us to see the percentage of contnuous variable, the percentage of discrete variables and whether or not some observations are missing.

Visualization of the data

First, we plot all the continous variables into histograms and their corresponding density plots.

plot_histogram(German_credit)

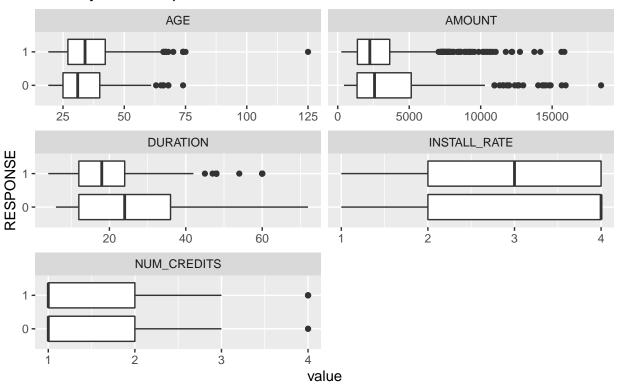

Our first notice is that the data are not really normally distributed. Some of them are right-tailed.

We can look at the tails and outliers more carefully through boxplots.

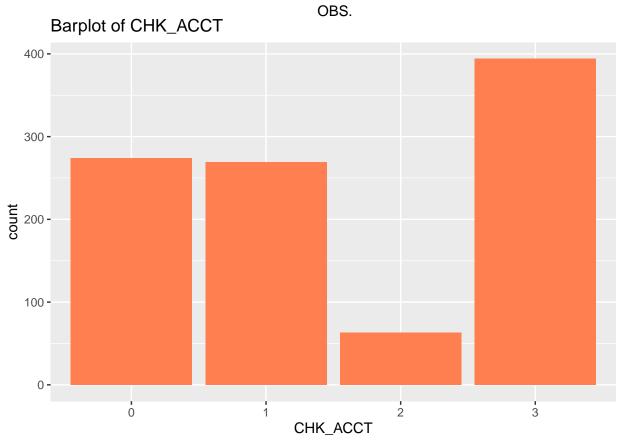

Side-by-side boxplots

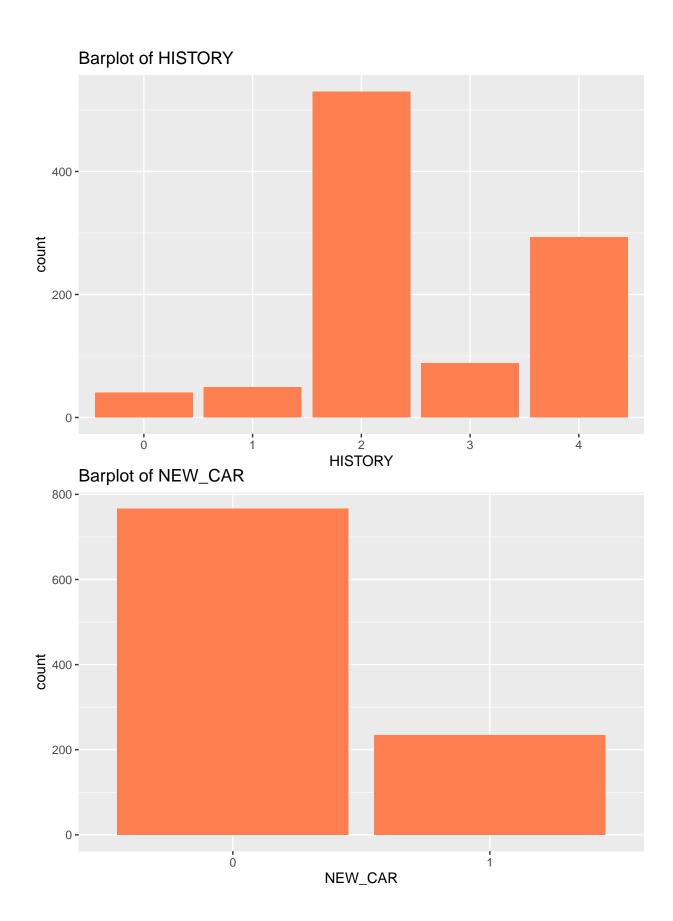

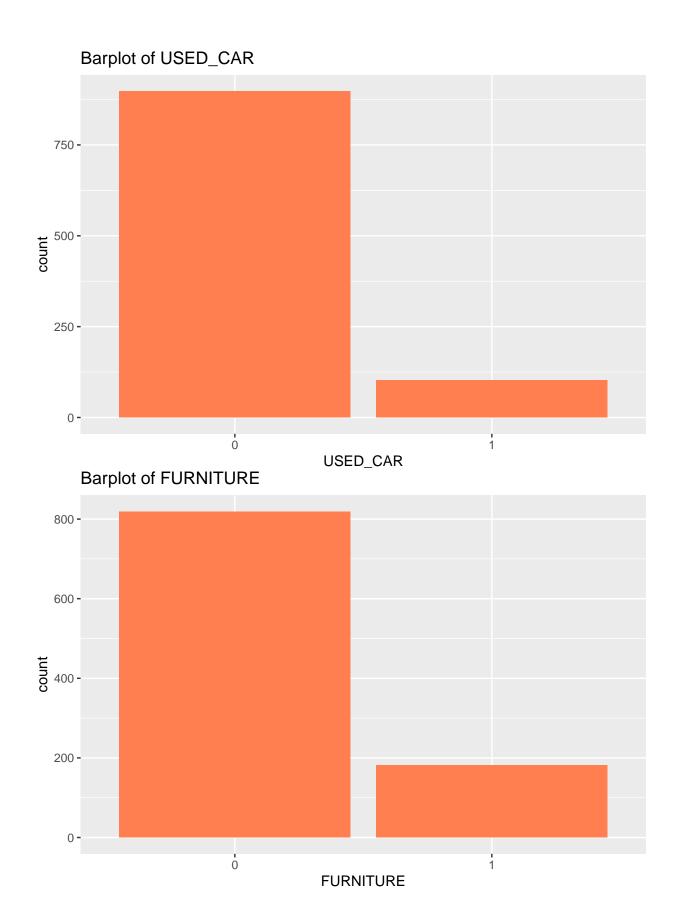

Now, we can make some barplots of the categorical variables.

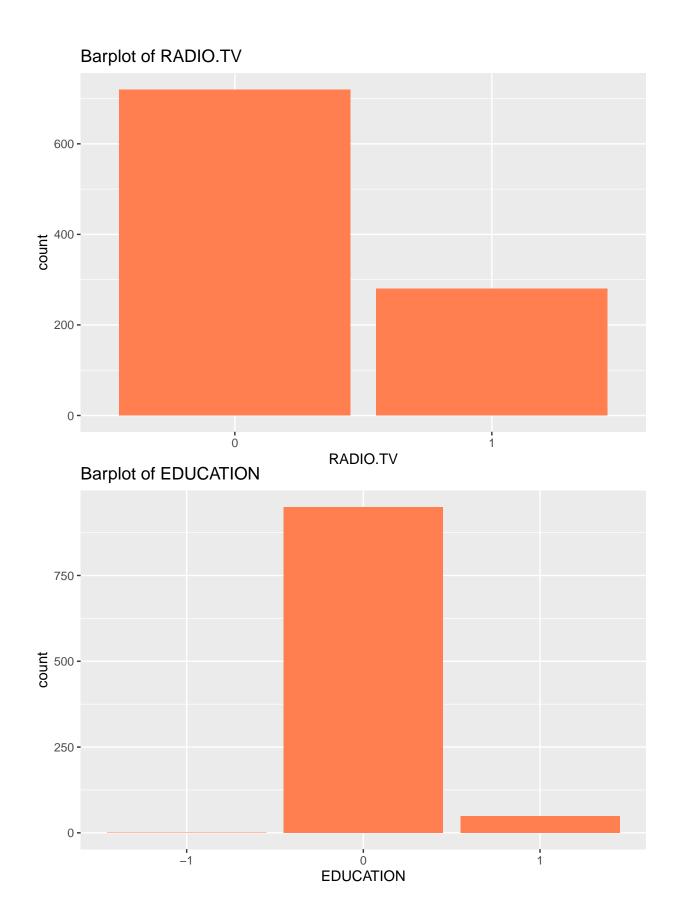

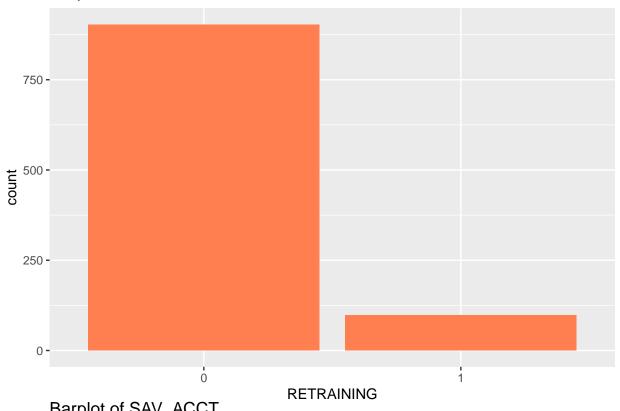

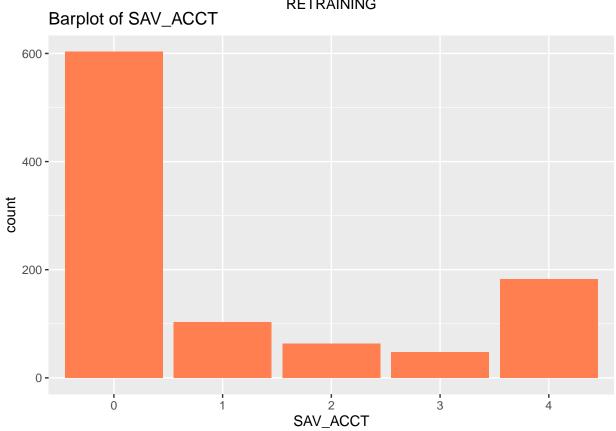

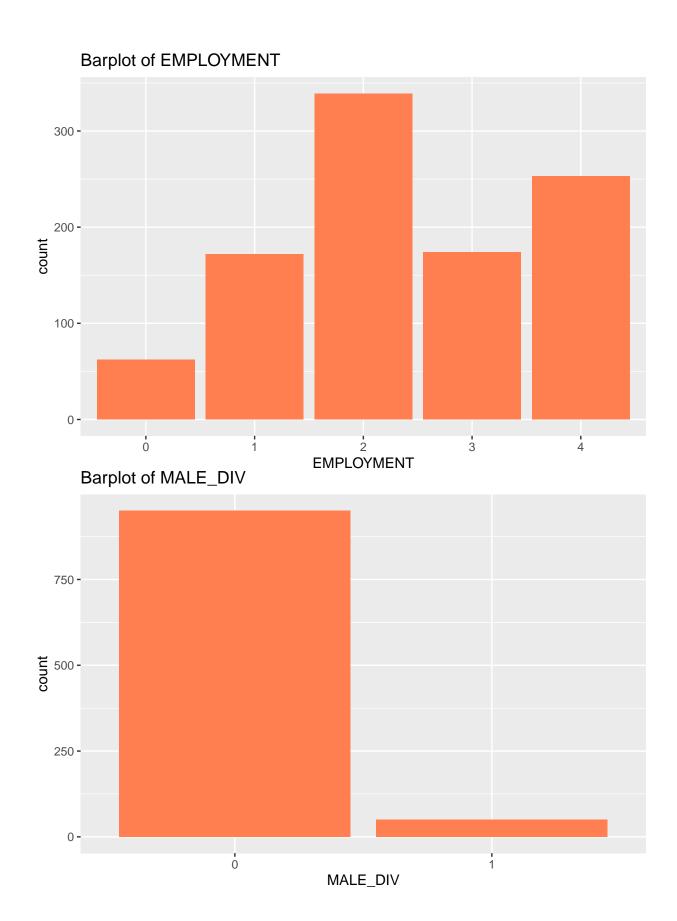

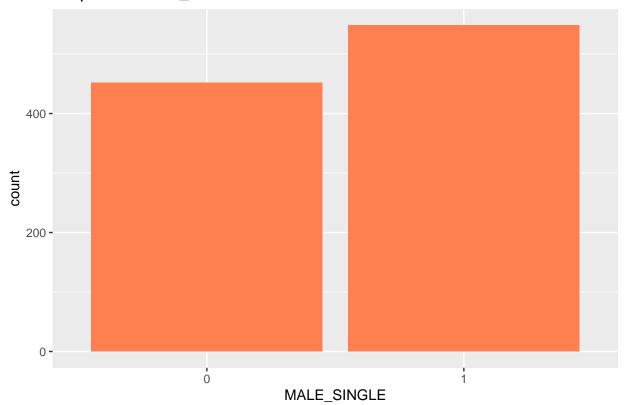

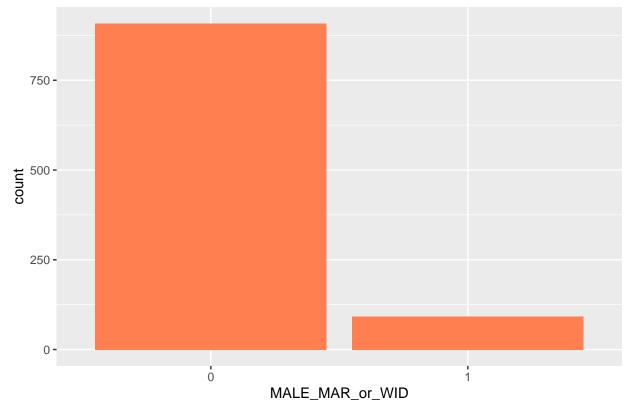

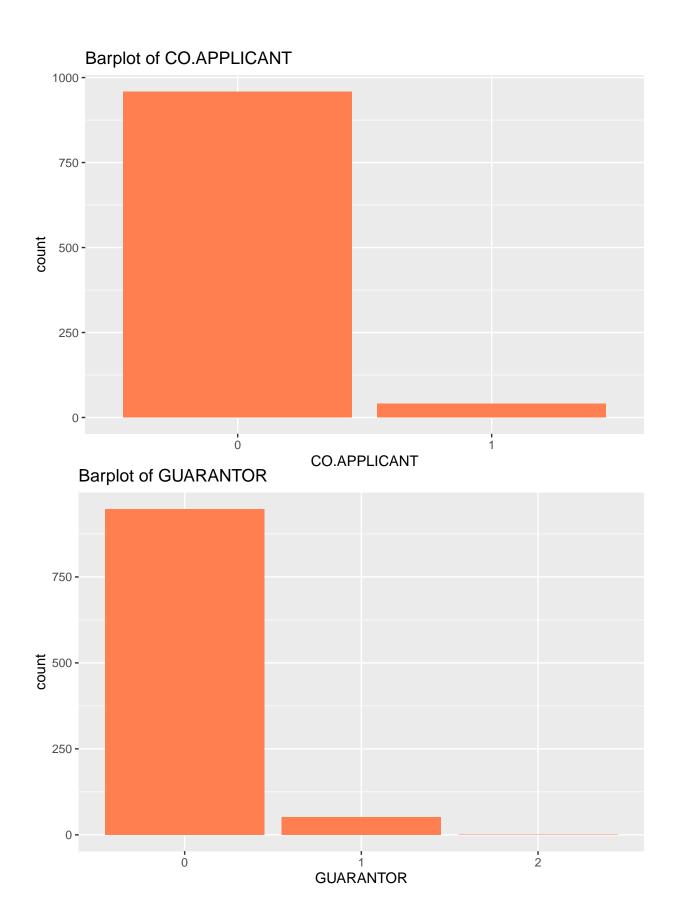

Barplot of MALE_SINGLE

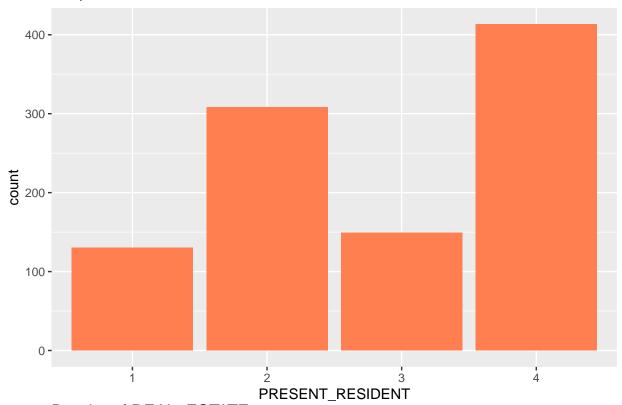

Barplot of MALE_MAR_or_WID

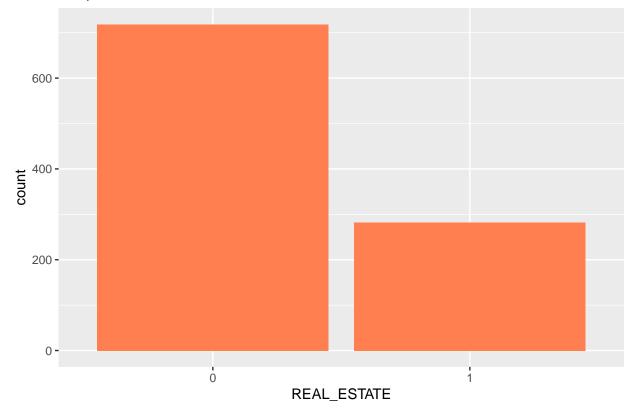

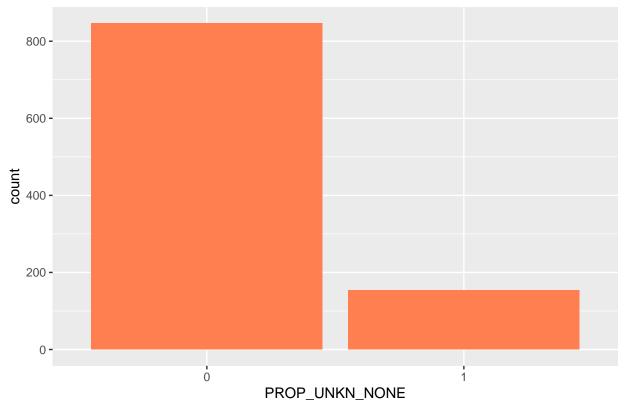

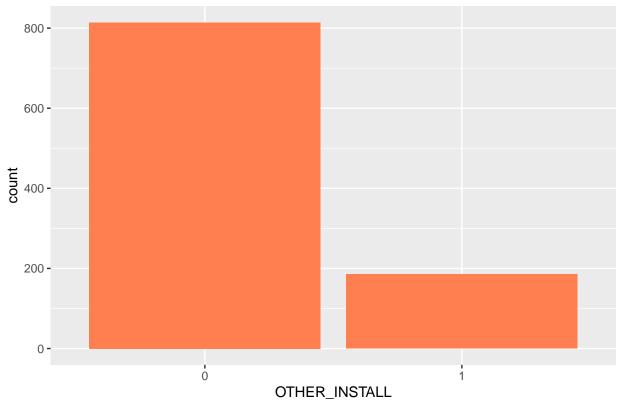

Barplot of REAL_ESTATE

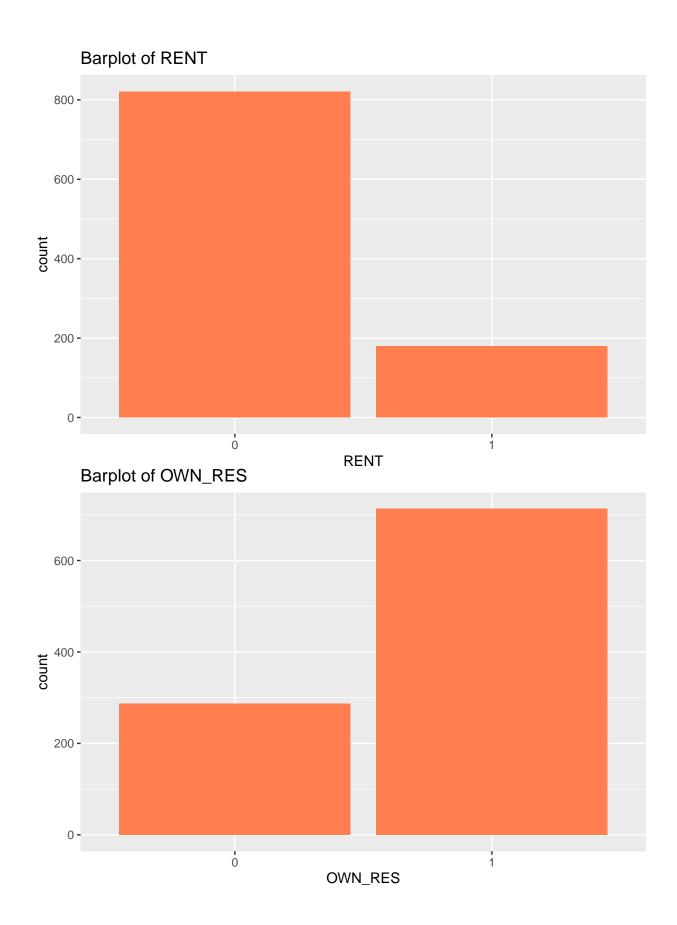

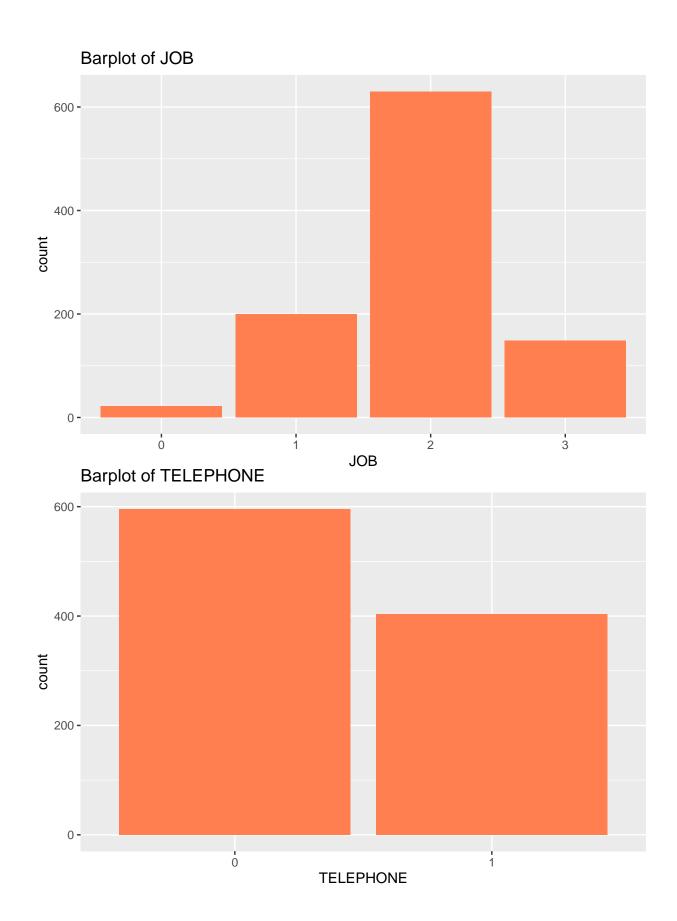

Barplot of PROP_UNKN_NONE

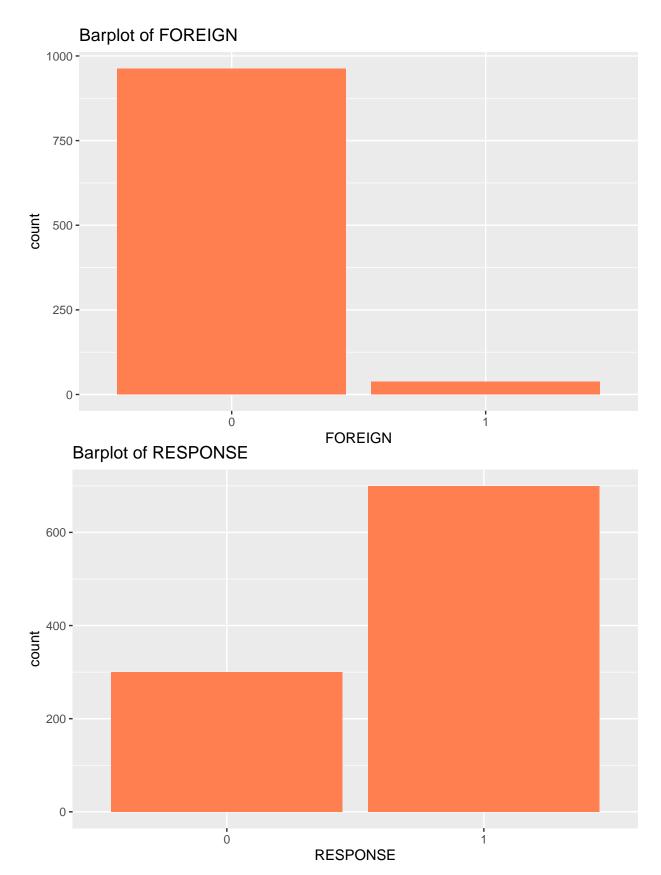

Barplot of OTHER_INSTALL

From those barplots we can see:

- The majority of people do not check their account status. (CHK_ACCT)
- Most people have an average balance of less than < 100 DM in their saving account (SAV_ACCT)
- Most of the applicants has its own residence (OWN_RES)
- Almost none of the applicants is a foreign worker (FOREIGN)

A general summary can be done.

Data Frame Summary

```
dfSummary(German_credit, style = 'grid')
```

```

Correlation plot:

Correlation plot between continuous variables :

```
plot_correlation(German_credit, type= 'c', cor_args = list( 'use' = 'complete.obs'))
```

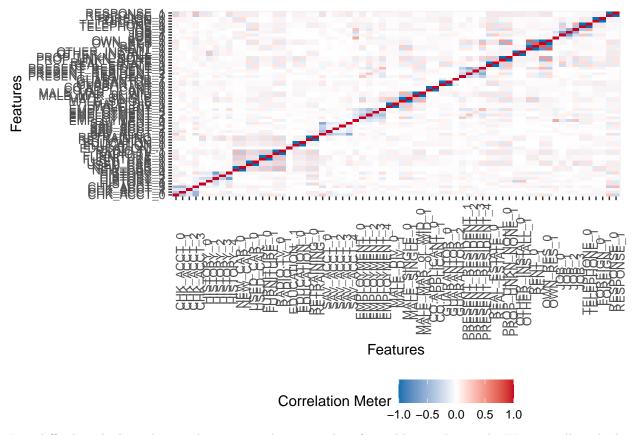

There are little correlation between the continuous variables. We can notice that there is a correlation of 62% between the variable **DURATION** and **AMOOUNT**.

Correlation plot between categorical variables :

```
plot_correlation(German_credit, type= 'd')
```

1 features with more than 20 categories ignored!

OBS.: 1000 categories

It is difficult to look at the correlation since there are a lot of variables on the graph. We can still see higher correlation between **RESPONSE 1**:

- and people that do not check their account (CHK_ACCT_3)
- and people that have a critical historical account (HISTORY 4)
- and the variable *REAL_ESTATE* (REAL_ESTATE)
- and applicant that does not have their own property (PROP_UNKN_NONE_0)
- and applicant that have their own residence (OWN_RES_1)

We can also see some correlation between **RESPONSE 0**:

- and people that have a checking account status < 0 DM (CHK ACCT 0)
- and people that have an average balance in savings account < 100 DM (SAV_ACCT_0)
- $\bullet\,$ and the variable $REAL_ESTATE$ (REAL_ESTATE)
